

**CAPÍTULO 2**

**PADRÕES DE  
MUDANÇA NAS  
TECNOLOGIAS E NOS  
MERCADOS**

## **2.1. A CURVA S: EVOLUÇÃO E ADOPÇÃO DE TECNOLOGIAS**

Waves of technological development, 1770–1990

Fonte: Dodgson (2000)

**Box 2.1. Major features of industry, 1950s–1990s**

1950s and 1960s 'Convergence & aggregation' (the 4th wave?)	1990s onwards 'Divergence & disaggregation' (the 5th wave?)
Dominance of large-scale, vertically integrated firms	Decentralized, network-based, flexible firms
Mass production systems, dedicated machinery	Lean production systems, flexible machinery
Mass, stable, standardized markets	Niche, rapidly changing markets, customer sovereignty
Centralized management	Decentralized management
Monopoly and oligopoly	Intense competition
Strongly directive government, state-owned utilities and telecoms, protectionist industry policies, tri-partisanship between government, unions and employers	Non-interventionism, privatization and deregulation, government as regulator not provider, free-trade policies
Strong role of trade unions: from policy-making to demarcation decisions	Declining power of unions, employers' concern for 'employees', multiskilling
Separation of management and ownership	Share-owning incentives and management buy-outs
Full-time secure employment	Significant part-time, contractual employment
Some internationalization of industrial production	Globalization of business
Nationalism in trade and industry policies	Pan-nationalism in trade and industry (EU, NAFTA, APEC)
Predominance of Western models of management	Integration of international best practice in models of management
Science and research undertaken in universities and large firms	Substantial increase in scale and scope of science and research and diversity in provision ('the new production of knowledge')
Technology development a feature of individual firms; not-invented-here syndrome; anti-trust legislation	Technological collaboration a feature of government policies and corporate strategies
Clear distinction between manufacturing, services, and resources sectors	Blurred boundaries in the knowledge economy
Competitiveness derived from tangible assets: capital, land, and labour	Competitiveness derived from intangible assets: skills, capabilities, creativity.

## **2.2. TRAJECTÓRIAS TECNOLÓGICAS**

# TRAJECTÓRIAS TECNOLÓGICAS

TRAJECTÓRIA TECNOLÓGICA é “a actividade de progresso tecnológico através dos trade-offs económicos e tecnológicos definidos por um paradigma\*” (Dosi e Orsenigo, 1988)

As trajectórias tecnológicas definem caminhos possíveis de evolução tecnológica

As estratégias de inovação empresarial são condicionadas pelos caminhos percorridos, nomeadamente em resultado de 2 tipos de restrições:

- Estado actual do conhecimento tecnológico
- Competências acumuladas (Base de Conhecimentos)

\*Um paradigma tecnológico incorpora um conjunto de propriedades técnicas, heurísticas de solução de problemas e experiência acumulada. Cada paradigma envolve uma definição dos problemas a abordar, das tarefas a desempenhar, do padrão de investigação, da tecnologia material a ser utilizada, e dos tipos de artefactos básicos a serem desenvolvidos e melhorados (Dosi e Orsenigo, 1988: 16)

**Table 5.1** Five major technological trajectories

	<b>Supplier-dominated</b>	<b>Scale-intensive</b>	<b>Information-intensive</b>	<b>Science-based</b>	<b>Specialized suppliers</b>
Typical core sectors	Agriculture Services Traditional manufacture	Bulk materials Automobiles Civil Engineering	Finance Retailing Publishing Travel	Electronics Chemicals	Machinery Instruments Software
Main sources of technology	Suppliers Production learning	Production engineering Production learning Design offices Specialised suppliers	Software and systems departments Specialised suppliers	R&D Basic research	Design Advanced users
Main tasks of technology strategy	Use technology from elsewhere to strengthen other competitive advantages	Incremental integration of changes in complex systems Diffusion of best design and production practice	Design and operation of complex information processing systems Development of related products	Exploit basic science Development of related products Obtain complementary assets Redraw divisional boundaries	Monitor advanced user needs Integrate new technology incrementally

*novation and Industrial Evolution*

FIGURE 4-3. The Dynamics of Innovation

Product	From high variety, to dominant design, to incremental innovation on standardized products
Process	Manufacturing progresses from heavy reliance on skilled labor and general-purpose equipment to specialized equipment tended by low-skilled labor
Organization	From entrepreneurial <i>organic</i> firm to hierarchical <i>mechanistic</i> firm with defined tasks and procedures and few rewards for radical innovation
Market	From fragmented and unstable with diverse products and rapid feedback to commodity-like with largely undifferentiated products
Competition	From many small firms with unique products to an oligopoly of firms with similar products

FIGURE 4-4. Significant Characteristics in the Three Phases of Industrial Innovation

	Fluid phase
Innovation	Frequent major product changes
Source of innovation	Industry pioneers; product users
Products	Diverse designs, often customized
Production processes	Flexible and inefficient, major changes easily accommodated
R&D	Focus unspecified because of high degree of technical uncertainty
Equipment	General-purpose, requiring skilled labor
Plant	Small-scale, located near user or source of innovation
Cost of process change	Low
Competitors	Few, but growing in numbers with widely fluctuating market shares
Basis of competition	Functional product performance
Organizational control	Informal and entrepreneurial
Vulnerabilities of industry leaders	To imitators, and patent challenges; to successful product breakthroughs

Transitional phase	Specific phase
Major process changes required by rising demand	Incremental for product and with cumulative improvements in productivity and quality
Manufacturers; users	Often suppliers
At least one product design, stable enough to have significant production volume	Mostly undifferentiated, standard products
Becoming more rigid, with changes occurring in major steps	Efficient, capital intensive, and rigid; cost of change high
Focus on specific product features once dominant design emerges	Focus on incremental product technologies; emphasis on process technology
Some subprocesses automated, creating islands of automation	Special-purpose, mostly automatic, with labor focused on tending and monitoring equipment
General-purpose with specialized sections	Large-scale, highly specific to particular products
Moderate	High
Many, but declining in numbers after emergence of dominant design	Few; classic oligopoly with stable market shares
Product variation; fitness for use	Price
Through project and task groups	Structure, rules, and goals
To more efficient and higher-quality producers	To technological innovations that present superior product substitutes

**FIGURE 9-3. Competence-Destroying Product and Process Discontinuities**

<p><b>Assembled/ Substitutes</b>            Photolithographic aligners (A)            Radial tires (A)            Diesel locomotive (A)            Ballpoint pen (A)            Jet aircraft engine (A)            Refrigerators (A)            Incandescent lamps (A)            All-steel automobile (A)</p>	<p><b>Assembled/ Market Broadening</b>            Solid-state minicomputers (N)            Integrated circuits minis (A)            Transistor (A)            Electronic calculator (A)            Tufted carpet (A)            Massively parallel supercomputers (A)</p>
<p><b>Nonassembled/ Substitutes</b>            Suspended preheating (D)            Glass drawing (D)            Continuous forming (D)            Float glass process (D)            Basic oxygen steel (A)            Direct reduction of iron (A)            Optical fibers (A)</p>	<p><b>Nonassembled/ Broadening</b>            Rotary kiln (A)            Container machine (N)            Owens process (A)            Vinyl (E)            Celluloid film (A)            Manufactured ice (A)            Synthetic gems (A)            Small liquid oxygen plants (A)</p>

(A) denotes an innovation originated predominantly from a new entrant or attacker; (D) denotes an innovation originated predominantly from an established firm or defender; (N) denotes that the origin of the innovation has not been classified, mainly cases in which no prior industry existed.

FIGURE 9-4. **Competence-Enhancing Product and Process Discontinuities**

<p><b>Assembled/ Substitutes</b>            Nuclear steam supply (A)            Air-cooled engines (D)            Nylon tire cord (N)            Hydrogen-cooled generator (D)            Fluorescent lamps (N)</p>	<p><b>Assembled/ Market Broadening</b>            Semiconductor memory (D)            Electric typewriter (A)</p>
<p><b>Nonassembled/ Substitutes</b>            Computerized kiln (D)            Edison long kiln (D)            Machine cylinder glass (D)            Gob-fed bottle machine (D)            Double gob machine (D)            Continuous casting (D)            Continuous drawn copper (D)            Oriented strand board (D)</p>	<p><b>Nonassembled/ Broadening</b>            Integrated circuits (A)            Continuous vertical kiln (A)</p>

(A) denotes an innovation originated predominantly from a new entrant or attacker;  
 (D) denotes an innovation originated predominantly from an established firm or defender;  
 (N) denotes that the origin of the innovation has not been classified, mainly cases in which no prior industry existed.

### Sources of Complexity in the Empirical Environments

EXHIBIT 1 A Technology Cycle

# *EXPLORATION* EM EMPRESAS INCUMBENTES

- Como conciliar *Exploring* e *Exploiting* em Empresas Estabelecidas?
- Será possível ter o melhor de 2 mundos?
- *Internal Corporate Venturing* como Solução?
- Duas perspectivas: Charitou & Markides (2003); e Lerner (2012)

# CHARITOU & MARKIDES (2003)

Fonte: Constantinos Charitou e Constantinos Markides (2003), 'Response to disruptive strategic innovation', Sloan Management Review, Winter, p. 55-63

# LERNER (2012): CONDIÇÕES PARA *CORPORATE VENTURING*

- *Corporate venturing*: Trazer o capital de risco para dentro da empresa
- Vantagens: Resposta rápida à mudança tecnológica (acesso a competências); induzir mudança no sentido desejado (caso da Intel); alavancar fundos externos; e flexibilidade.
- Problemas: Indefinição de objetivos; falta de consistência e sustentabilidade; inércia; e domínio da estrutura estabelecida.

**ESTRATÉGIAS DE  
COMERCIALIZAÇÃO DA  
TECNOLOGIA: DE  
TEECE (1986) A GANS &  
STERN (2003)**

	Strong legal/technical appropriability	Weak legal/technical appropriability		
		Innovator excellently positioned versus imitators with respect to commissioning complementary assets	Innovator poorly positioned versus imitators with respect to commissioning complementary assets	
<p>Key</p> 	<p>Innovators and imitators advantageously positioned vis-à-vis independent owners of complementary assets</p>	<p>(1) <i>Contract</i>  Innovator will win</p>	<p>(2) <i>Contract</i>  Innovator should win</p>	<p>(3) <i>Contract</i>  Innovator or imitator will win; asset owners won't benefit</p>
	<p>Innovators and imitators disadvantageously positioned vis-à-vis independent owners of complementary assets</p>	<p>(4) <i>Contract if can do so on competitive terms; integrate if necessary</i>  Innovator should win; may have to share profits with asset holders</p>	<p>(5) <i>Integrate</i>  Innovator should win</p>	<p>(6) <i>Contract (to limit exposure)</i>  Innovator will probably lose to imitators and/or asset holders</p>

# O CASO KODAK

- Quais as razões que estiveram na base da ascensão da Kodak?
- Quais os factores que conduziram à sua queda?
- Como podemos interpretar o declínio da Kodak com base no que estudámos neste Capítulo?
